

SEPSIS

The most preventable cause of death, worldwide

Every year, around the world **8 million** people die from sepsis.

As many as 80% of sepsis deaths could be prevented by rapid diagnosis and treatment. Healthcare providers are key.

What is Sepsis?

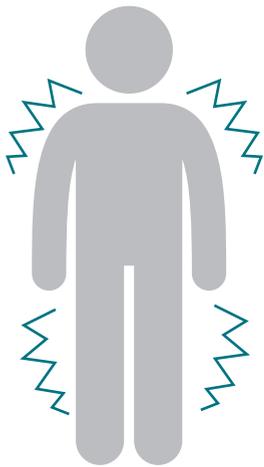

Sepsis is a life-threatening condition that occurs when the body's response to an infection damages its own tissues and organs.

Even a minor infection can lead to sepsis

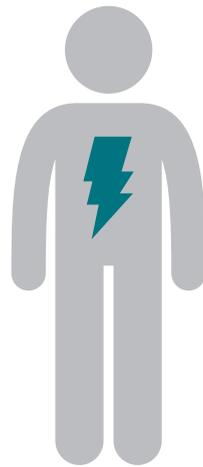

4 most common infections that can lead to sepsis:

If recognized early, sepsis can be treated

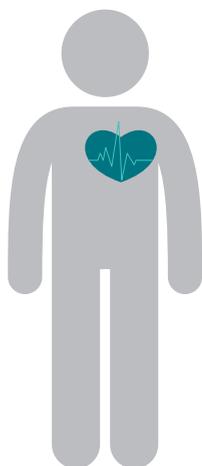

High or low body temperature

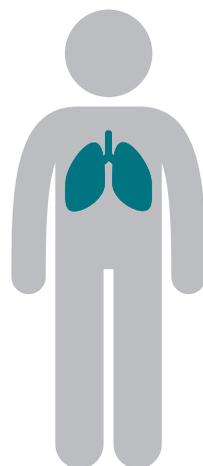

Severe pain or discomfort

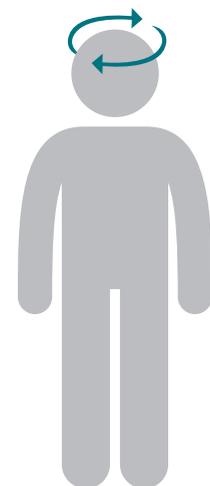

Clammy or sweaty skin

High heart rate

Short of breath

Altered mental state
(Confusion, disorientation, lethargy)

Quick diagnosis = more lives saved
